

NASA GEOS Forecasting Capabilities for Air Quality

K. Emma Knowland

Morgan State University/GESTAR-II

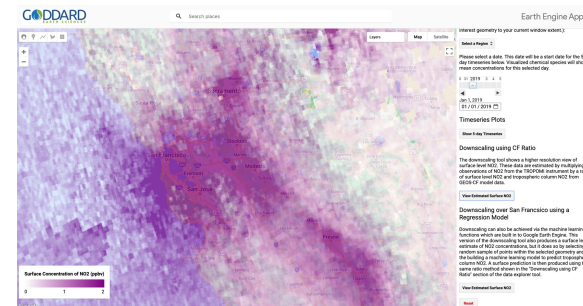

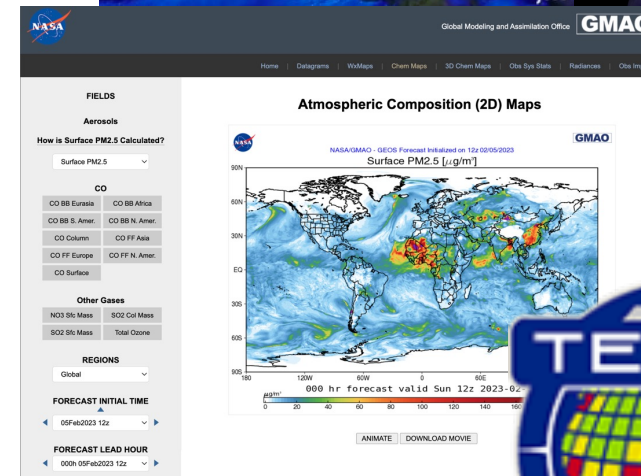

NASA Global Modeling and Assimilation Office (GMAO)

**In collaboration with Christoph Keller, Carl Malings and many other
scientists from GMAO and other labs at NASA Goddard Space Flight
Center**

OUTLINE

1. Overview of GEOS current capabilities
 - Numerical Weather Prediction
 - Composition Forecasting
2. How to access GEOS “big data” for research scientists and engaged community members
3. Bias-correcting techniques for Air Quality decision making

GMAO's core mission is to enhance the value of NASA's observations to understand, analyze and predict changes in the physics, chemistry and biology of the Earth system

How NASA and Google are teaming up to understand and analyze air quality around the world

By Karin Tuxen-Bettman, PhD, Program Manager, Google Earth Outreach

Nicholas Clinton, PhD, Developer Advocate, Google Earth Engine

Argyro Kavvada, PhD, Program Lead, Sustainable Development Goals, Applied Sciences Program, NASA Earth Science Division

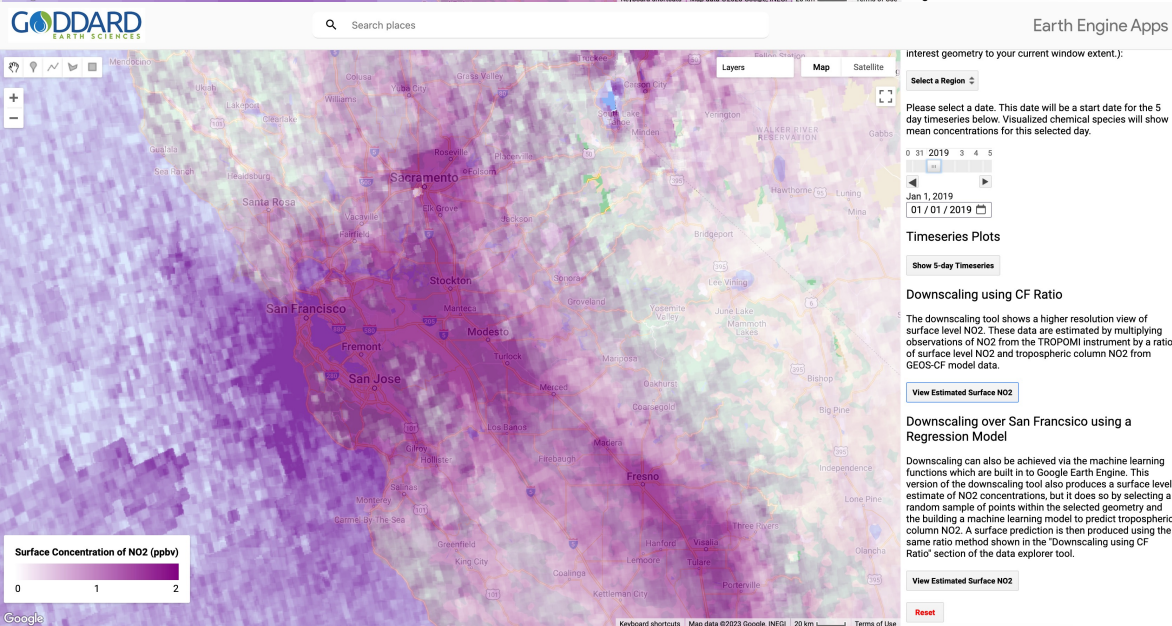

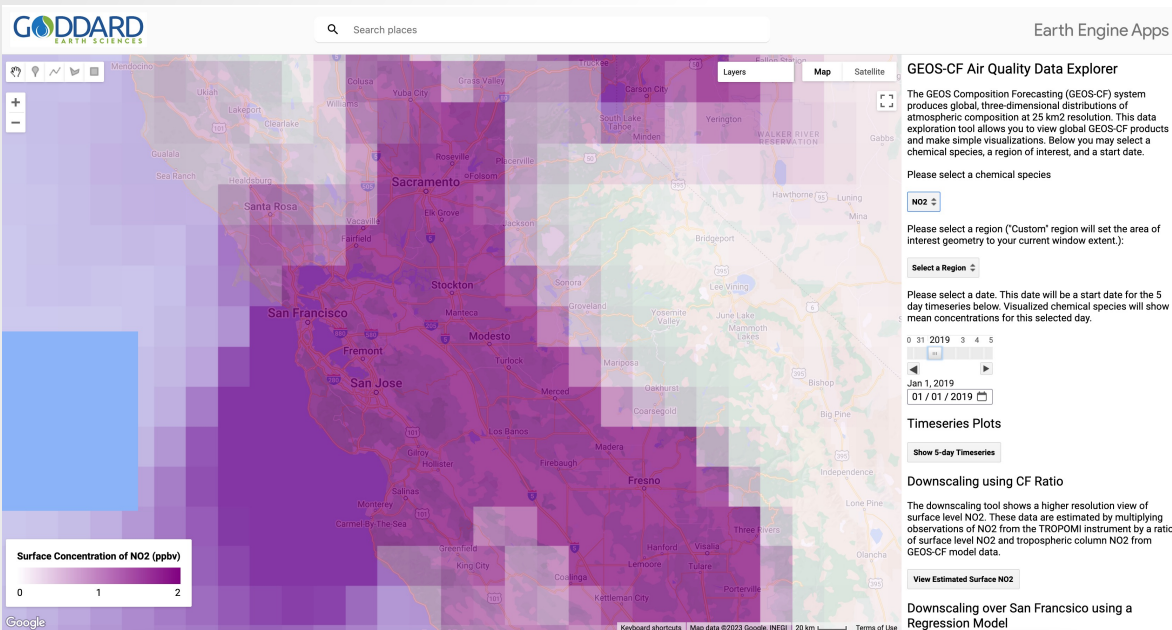

Part of the NASA-Google Partnership, select GMAO products are now being ingested into GEE:

- **GEOS-CF** hourly-average surface fields (chemistry and meteorology)
- **MERRA-2** hourly-average aerosol fields

<https://medium.com/google-earth/how-nasa-and-google-are-teaming-up-to-understand-and-analyze-air-quality-around-the-world-7c89f6efad3d>

Global -> local scale estimates

Part of the NASA-Google Partnership, select GMAO products are now being ingested into GEE:

- **GEOS-CF** hourly-average surface fields (chemistry and meteorology)
- **MERRA-2** hourly-average aerosol fields

Google Earth Engine and Google Cloud tools provide researchers the option to layer together different datasets in GEE and perform statistical methods and machine learning techniques which can downscale the global model reanalysis and forecasts to help improve on the biases at the sub-grid scale.

https://gmao.gsfc.nasa.gov/research/science_snapshots/2023/new-generation-gmao-apps.php

Daily atmospheric composition forecast

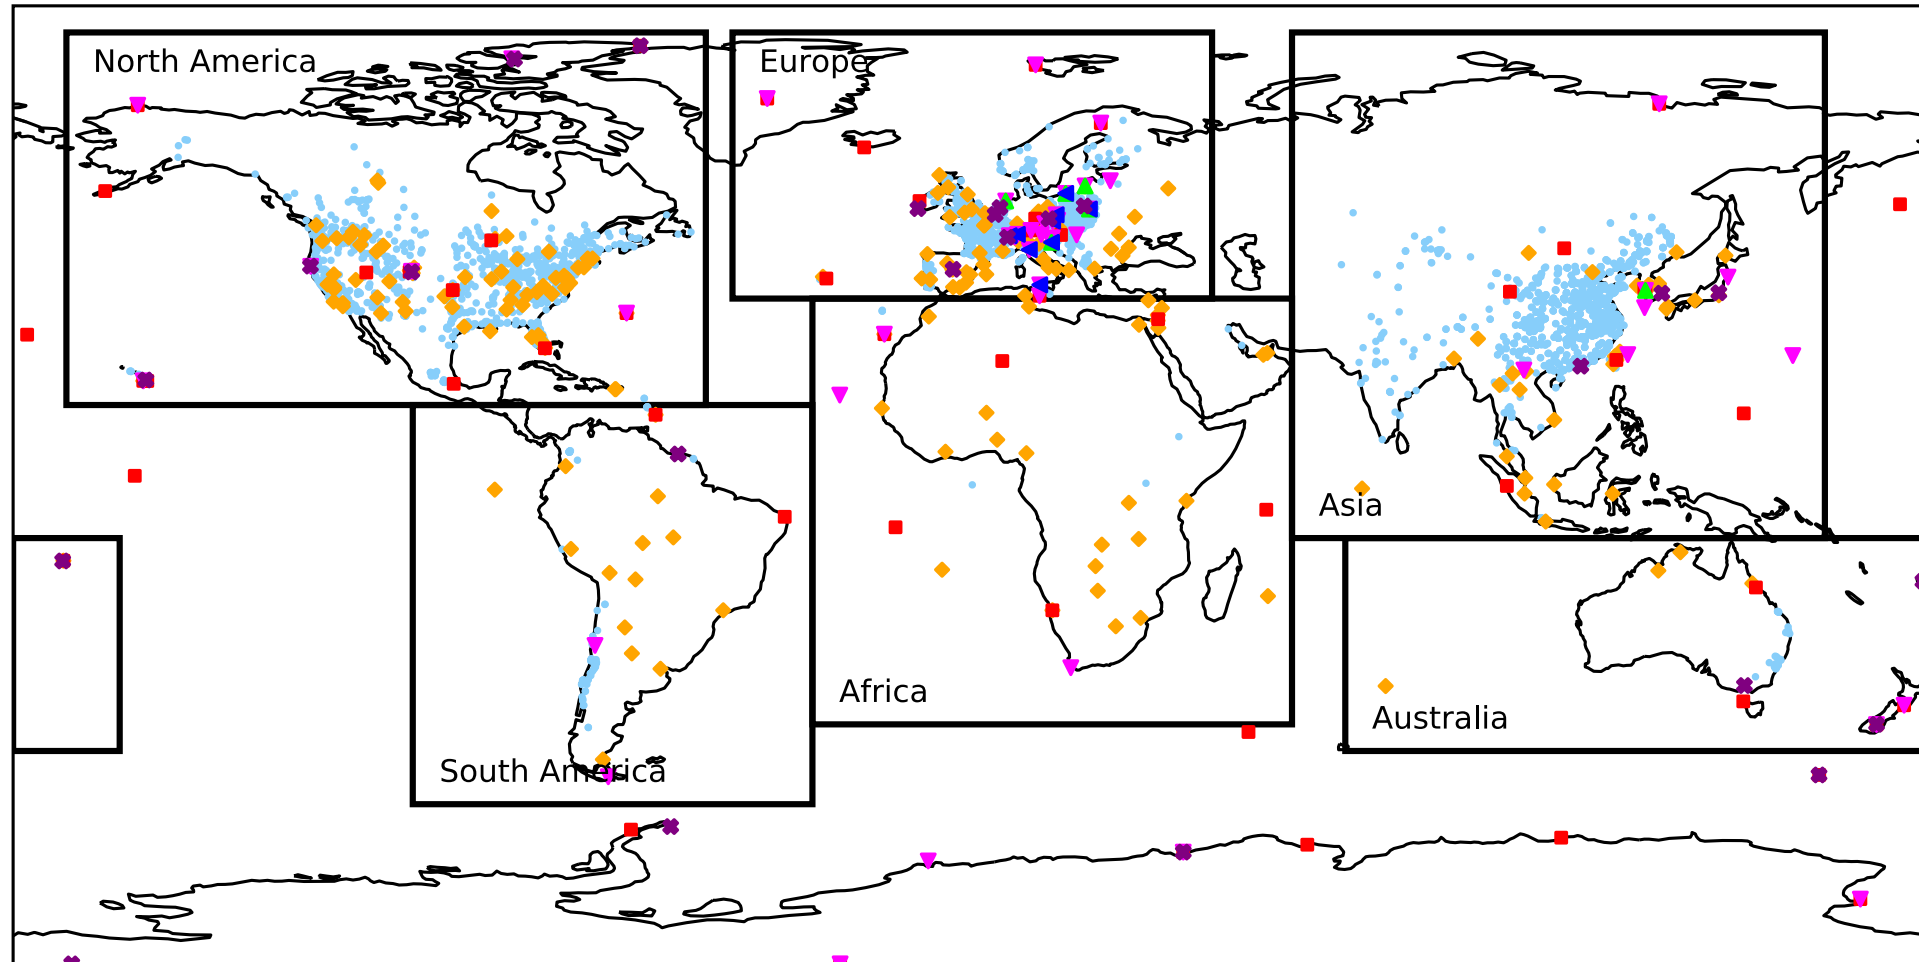

A realistic stratosphere in GEOS-CF is essential to support a broad range of NASA applications, including:

- Satellite retrievals of trace gases
- Airborne campaigns
- Stratosphere-troposphere exchange

Observations for evaluation

Keller et al., 2021 JAMES

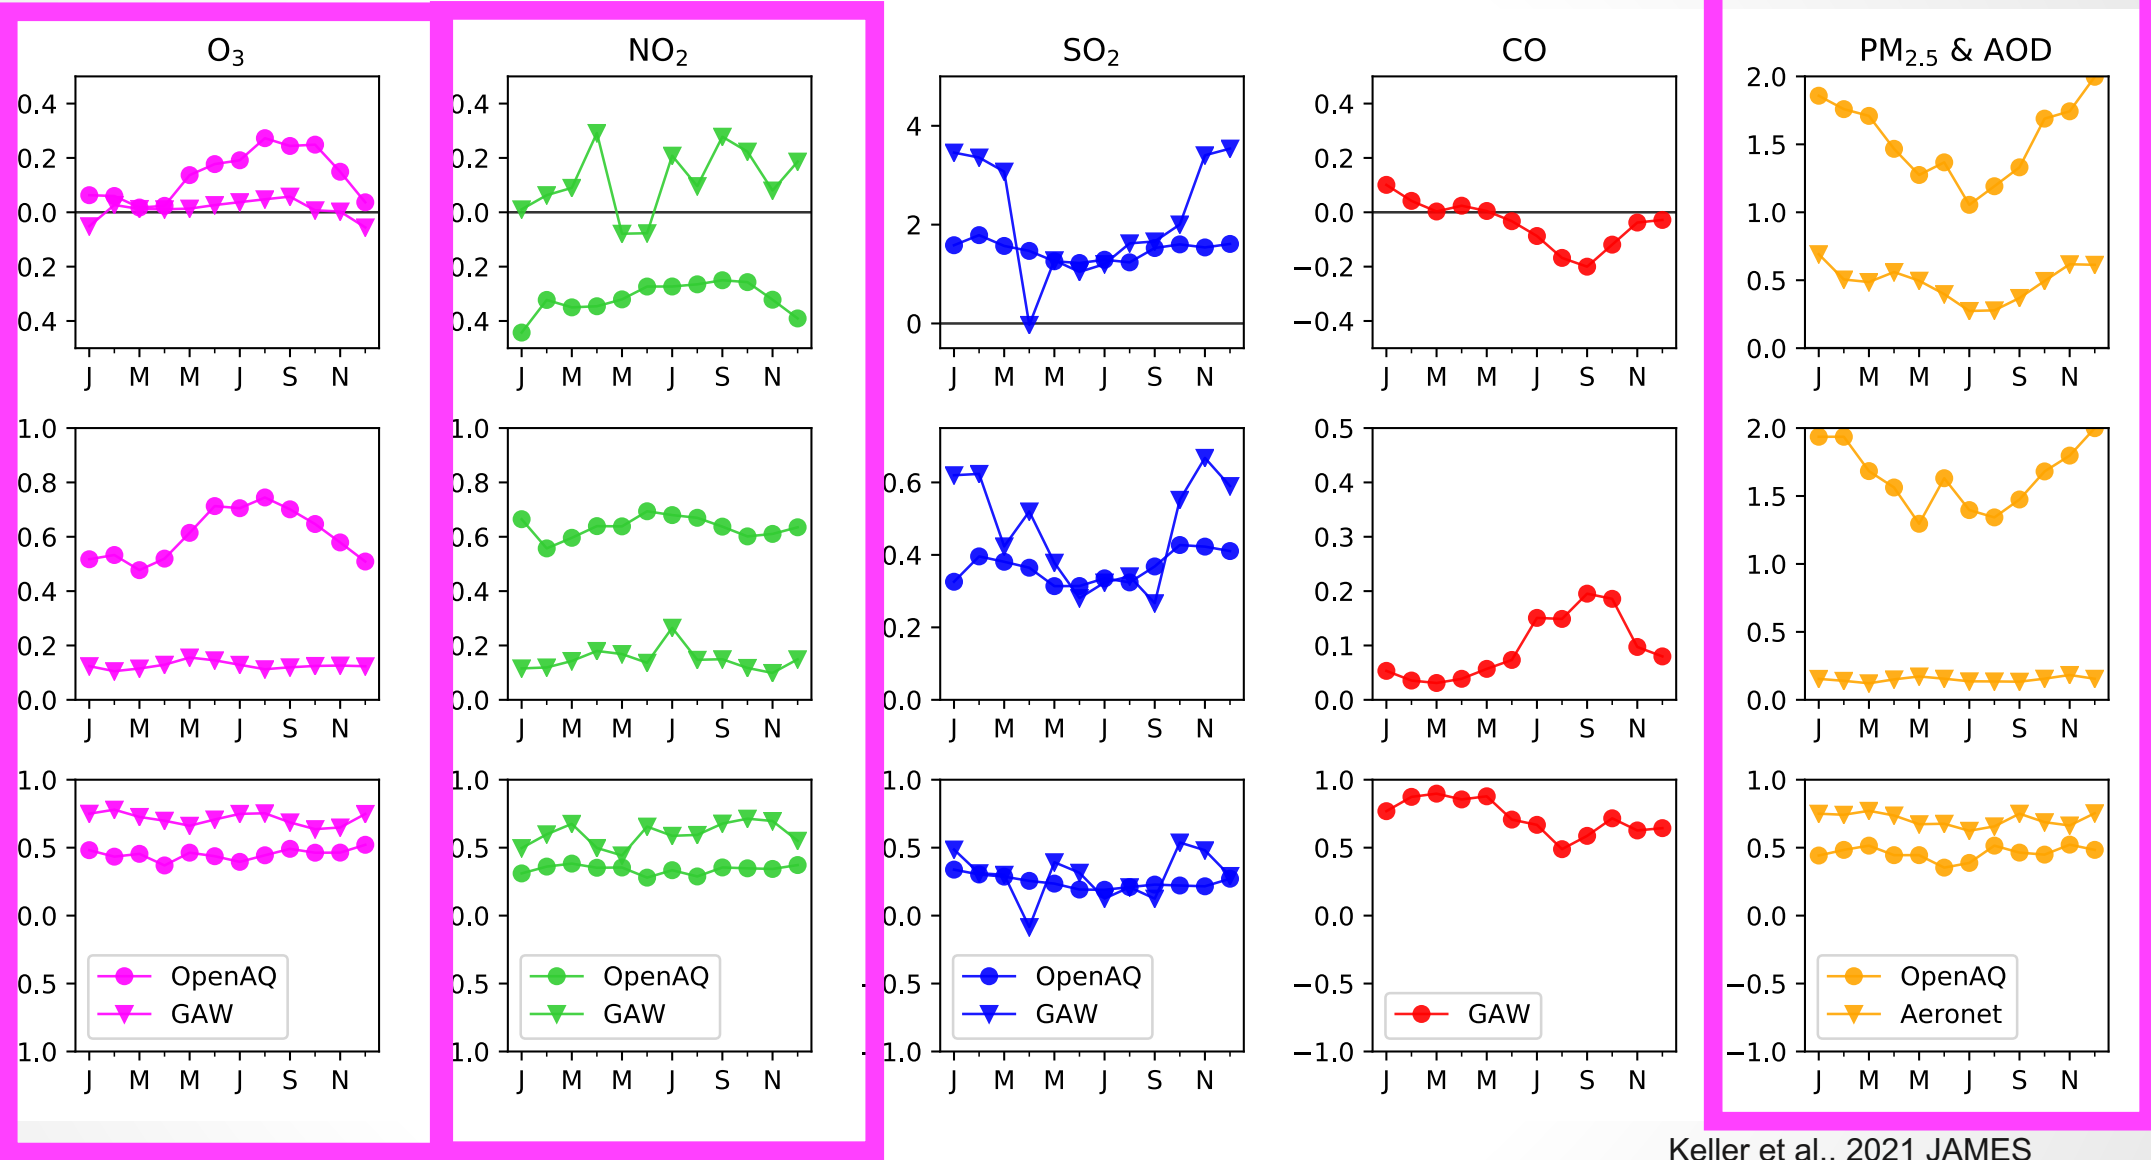

Global surface comparisons - monthly

Normalized Mean Bias (NMB)

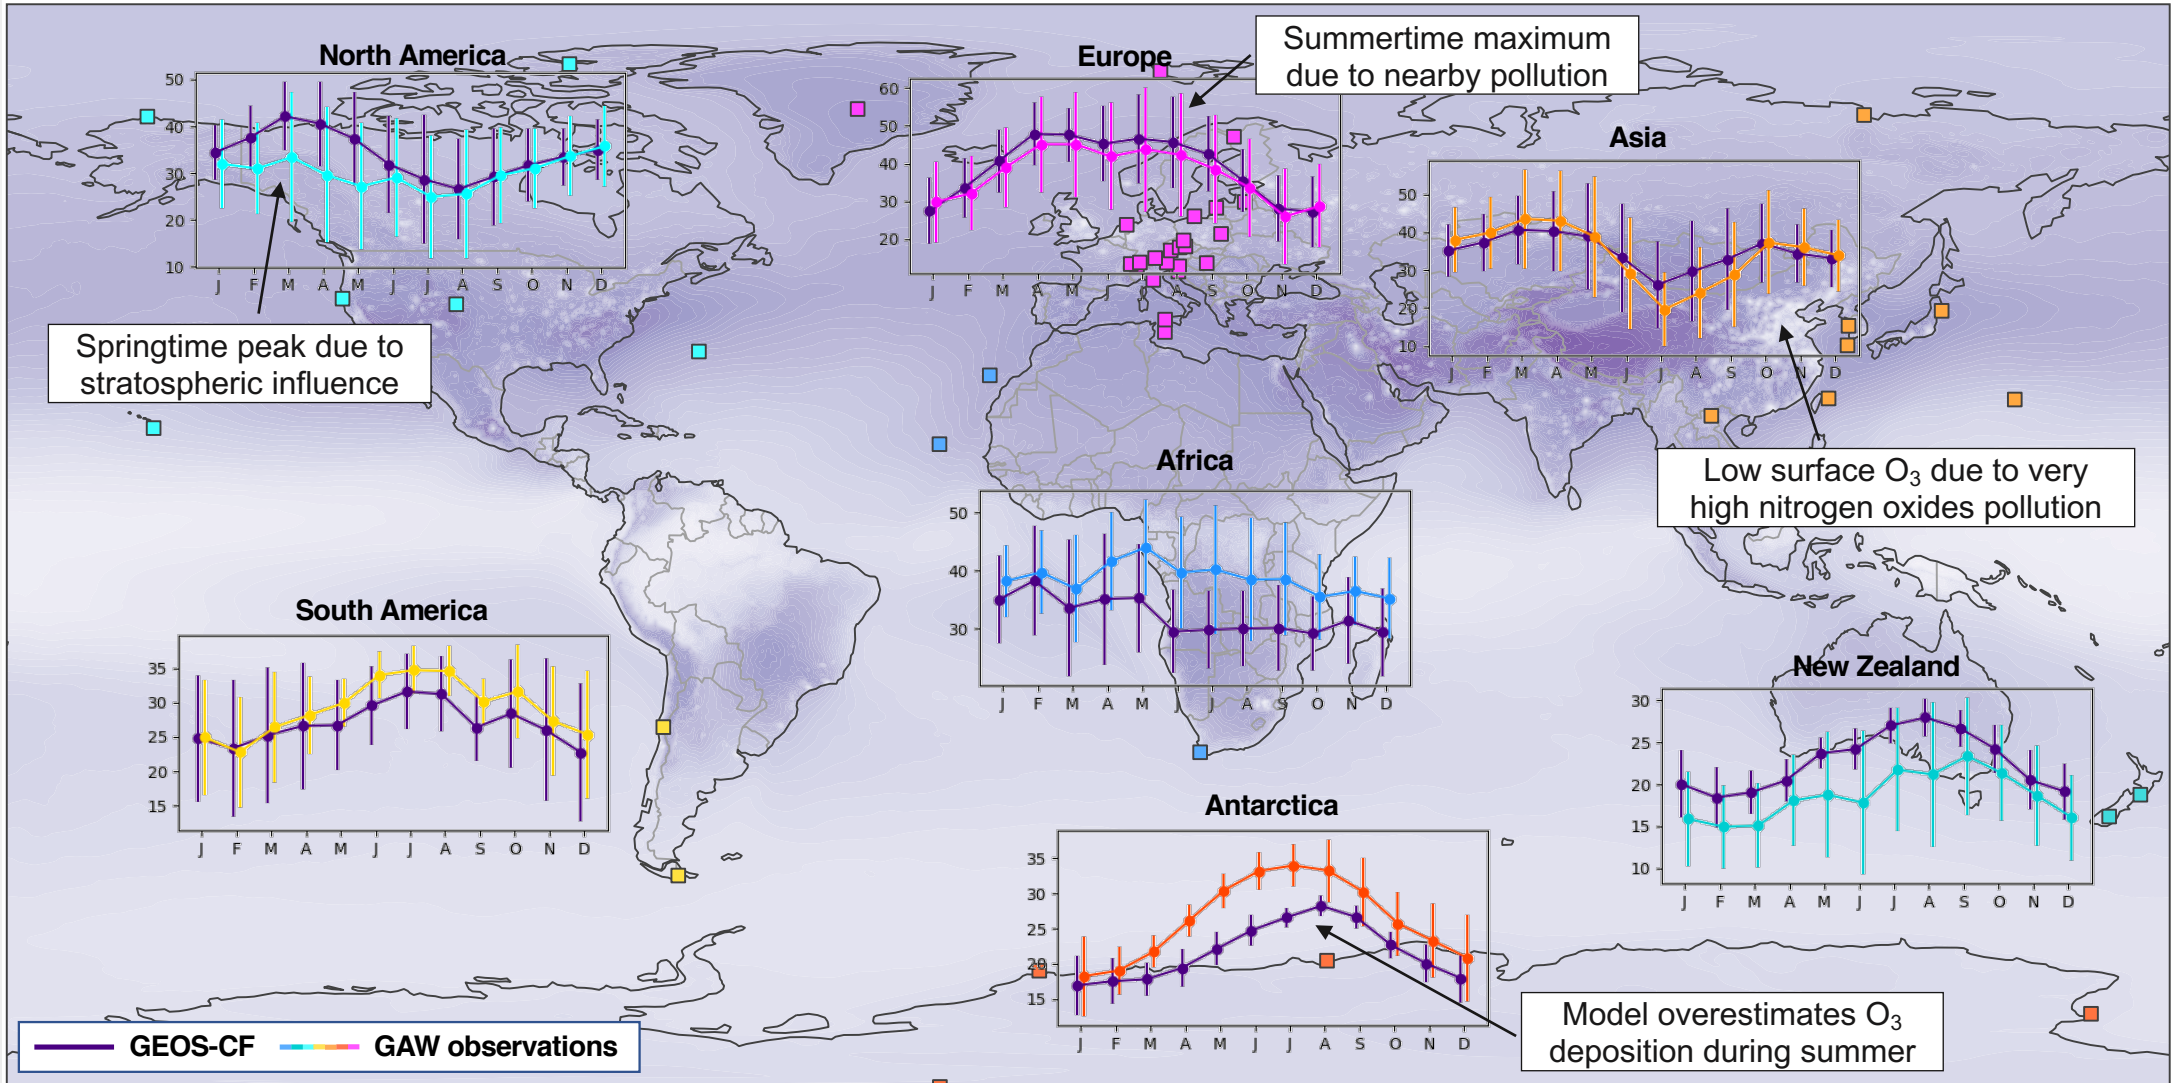

Normalized Root Mean Square Error (NRMSE)

Pearson Correlation Coefficient (R)

Keller et al., 2021 JAMES

GEOS-CF surface ozone compares well against background observations from the Global Atmospheric Watch (GAW) network

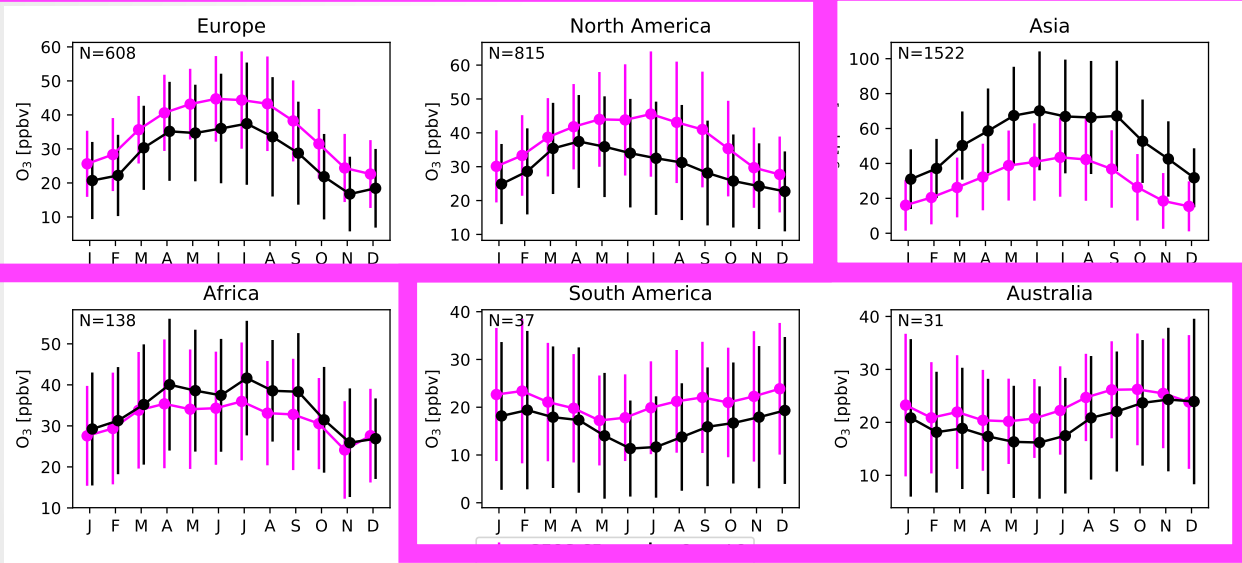

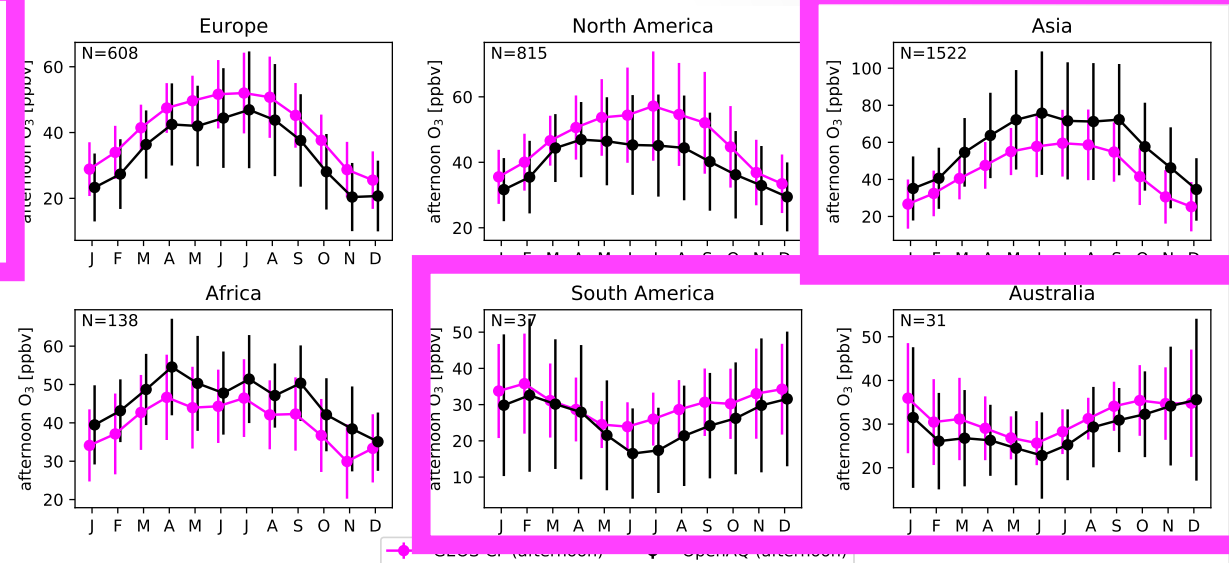

Surface O₃ (OpenAQ sites only)

Daily

Afternoon only

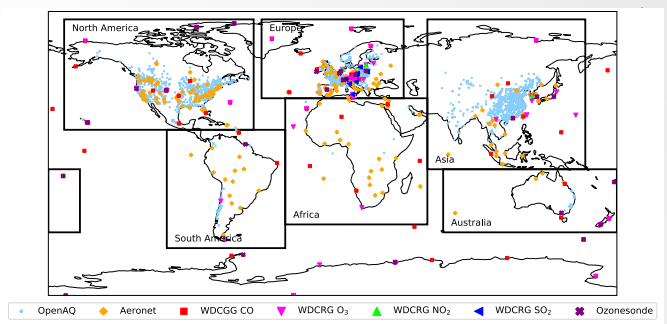

- GEOS-CF captures the overall seasonal cycle in the six regions, but generally overestimates in Europe, North & South America and Australia, while underestimating in Asia and Africa.

- In polluted regions, such as Asia, the bias is reduced when focusing on peak photochemical production period. GEOS-CF still has a bias over US during summer and fall, a known GEOS-Chem issue (Travis et al., 2016;2019; Hu et al., 2018).

■ Observations ■ GEOS-CF

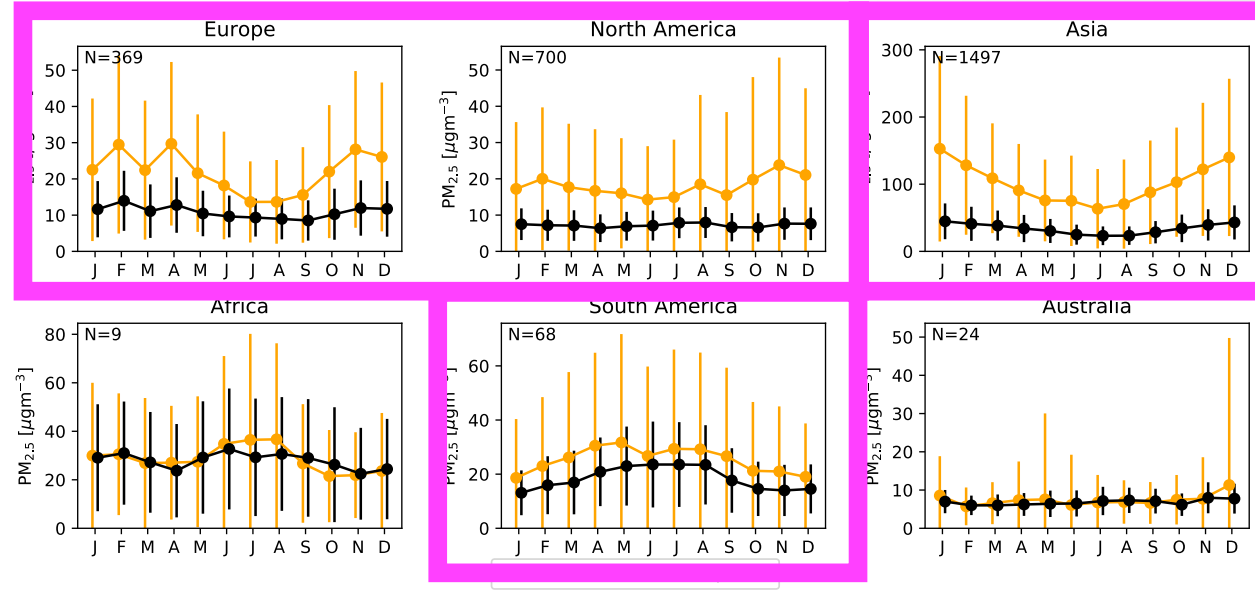

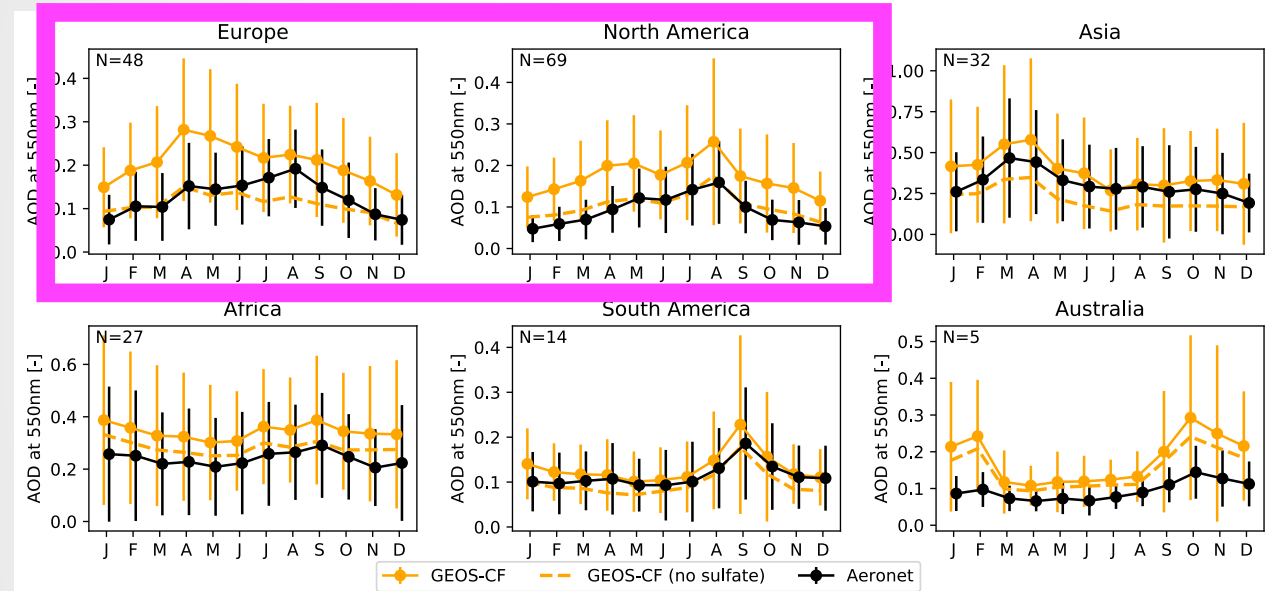

Keller et al., 2021 JAMES

GEOS-CF generally overestimates aerosols (AOD and PM_{2.5})

AOD from Aeronet network

PM_{2.5} from OpenAQ database

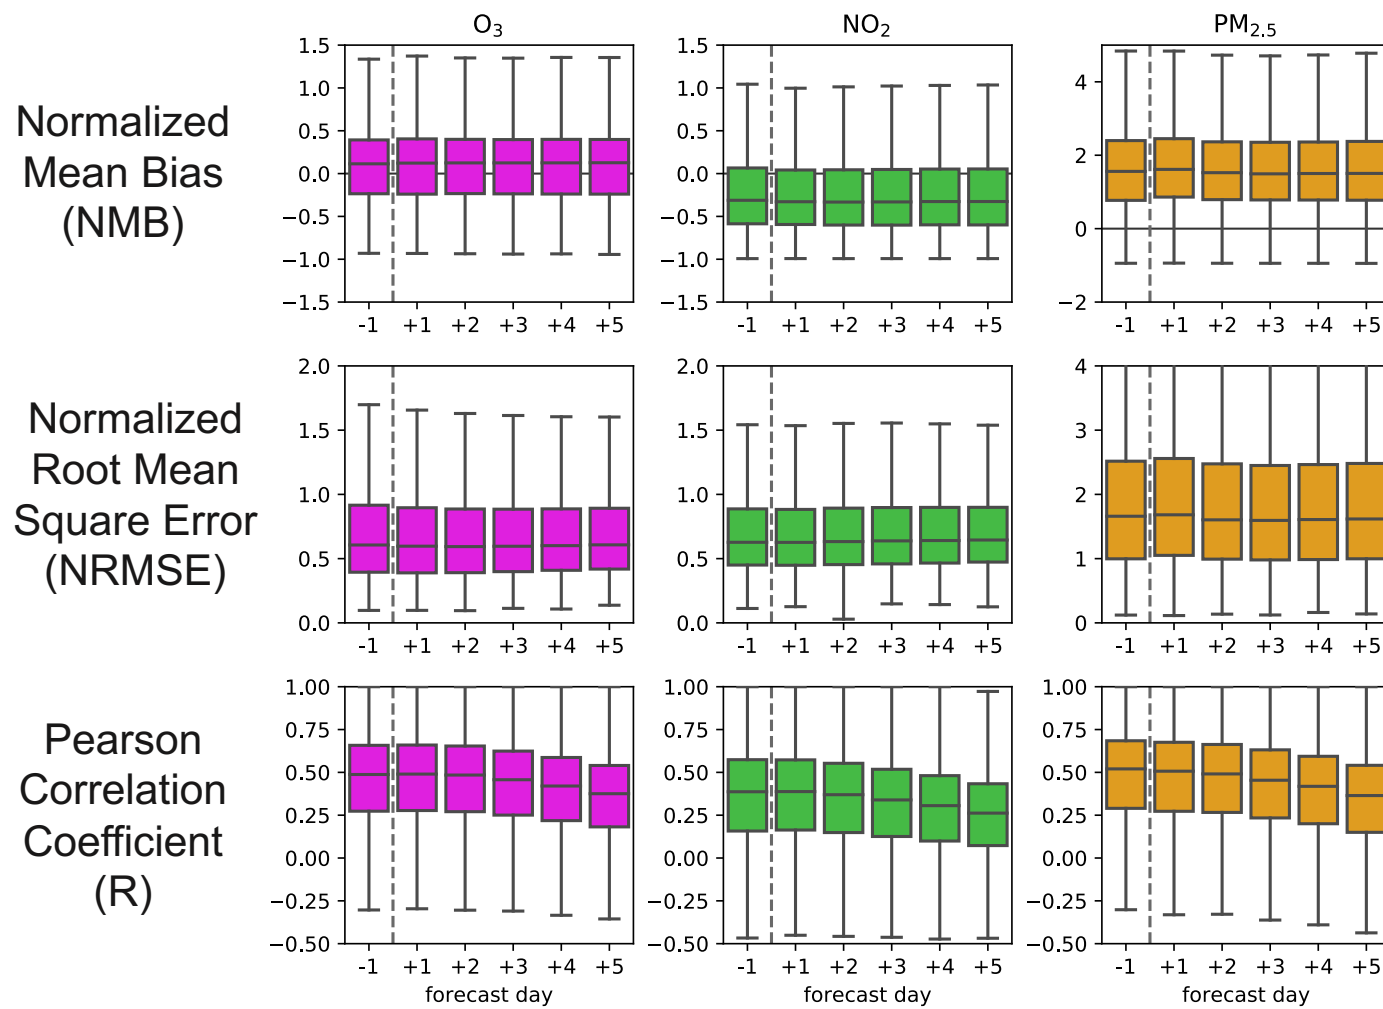

- GEOS-CF overestimates AOD 550 nm at most Aeronet sites. This is likely due to the overestimation of sulfates in the model.

- Similarly, GEOS-CF PM_{2.5} is overestimated in Europe, North America, Asia and South America.

■ Observations ■ GEOS-CF

Keller et al., 2021 JAMES

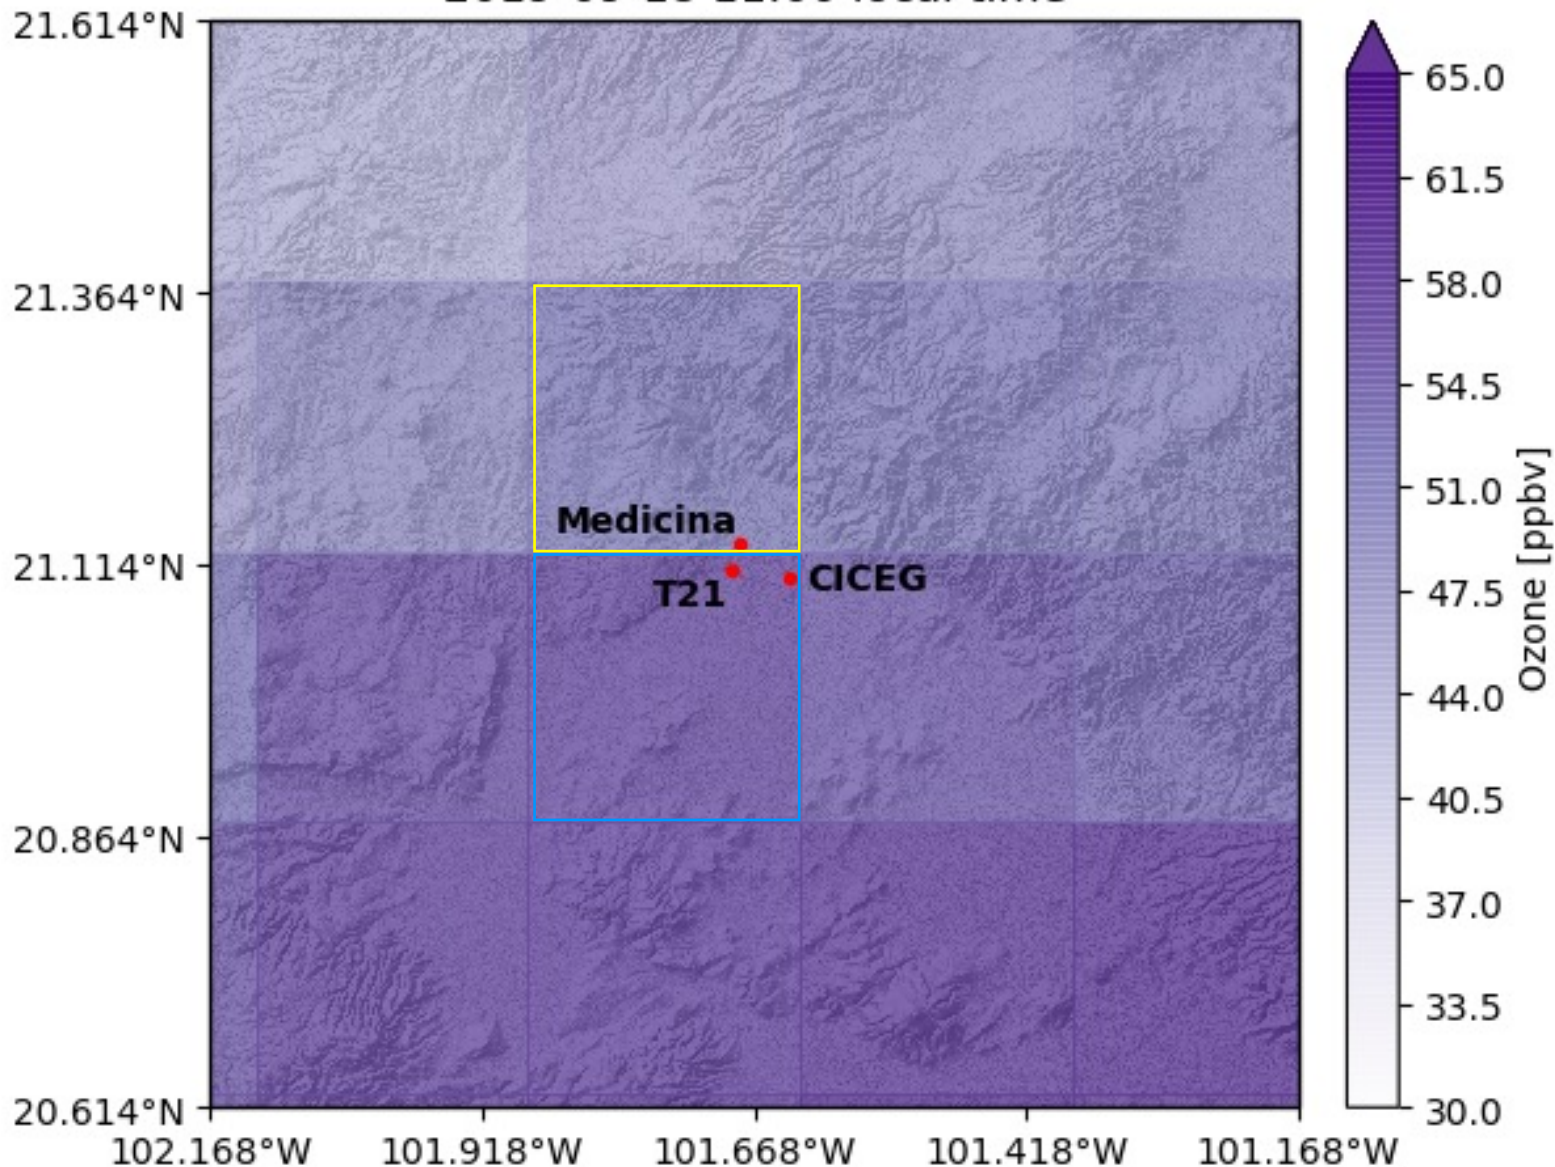

GEOS CF Forecast skill (GAW and OpenAQ)

- Little variation in the skill scores out to 5 days
- Correlation tends to decrease after day 2 and this is likely due to changes in the meteorological forecast and biomass burning emissions.

NASA/GMAO - GEOS CF Forecast Initialized on 12z 10/19/2022
Surface NO₂

000 hr forecast valid Wed 12z 2022-10-19

Global Data Sources

Copernicus TROPOMI Nitrogen Dioxide Product (Orbit #9397)

Tropospheric vertical column of nitrogen dioxide (10⁻⁴ mol m⁻²)

simulation models

- + global coverage
- + forecasting
- limited resolution
- ? updated emissions

satellite retrievals

- + global coverage
- low time resolution
- column-integrated
- ? relevant to surface

regulatory monitoring

- + accurate
- expensive
- ? representative

Local Data Sources

low-cost monitoring

- + relatively inexpensive
- + dense/remote deployment
- greater noise and bias
- ? locally calibrated

Our project's objective is to...

...integrate diverse **global** and **local** air quality data sources...

...using the cloud computing platform of **Google Earth Engine**...

...to provide synthesized **estimates** and **forecasts** of air quality at a **local scale** but with a **global scope**...

...which will be freely accessible by air quality managers worldwide, facilitating their **decision-making** processes.

Project Scheme and Partners

NASA GMAO: basic algorithm development & refinement

Clarity: low-cost sensor integration

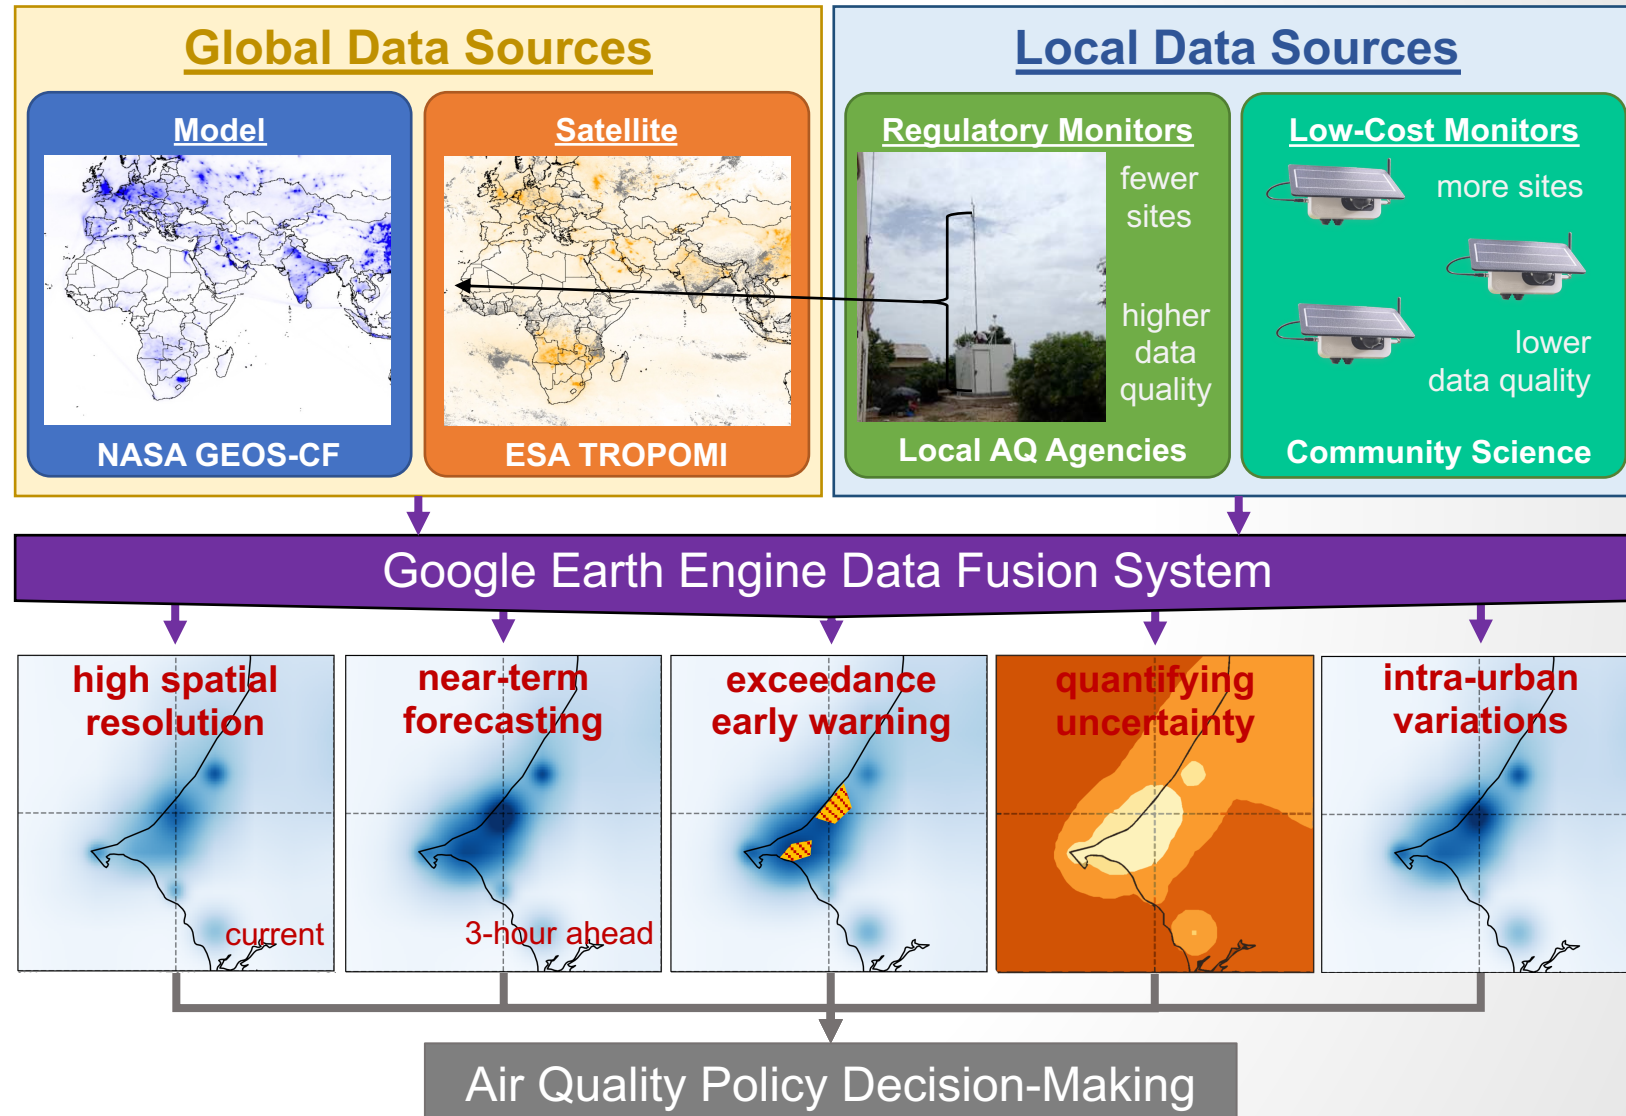

Sonoma Technologies: data fusion system implementation & user interface

WUSTL: air quality data integration expertise (monthly/annual timescales)

Columbia LDEO: experience training end-users in AQ data interpretation

UNEP: integration with global end-users
Dakar, Senegal
Rio de Janeiro, Brazil

US EPA: integration with US end-users in cities TBD

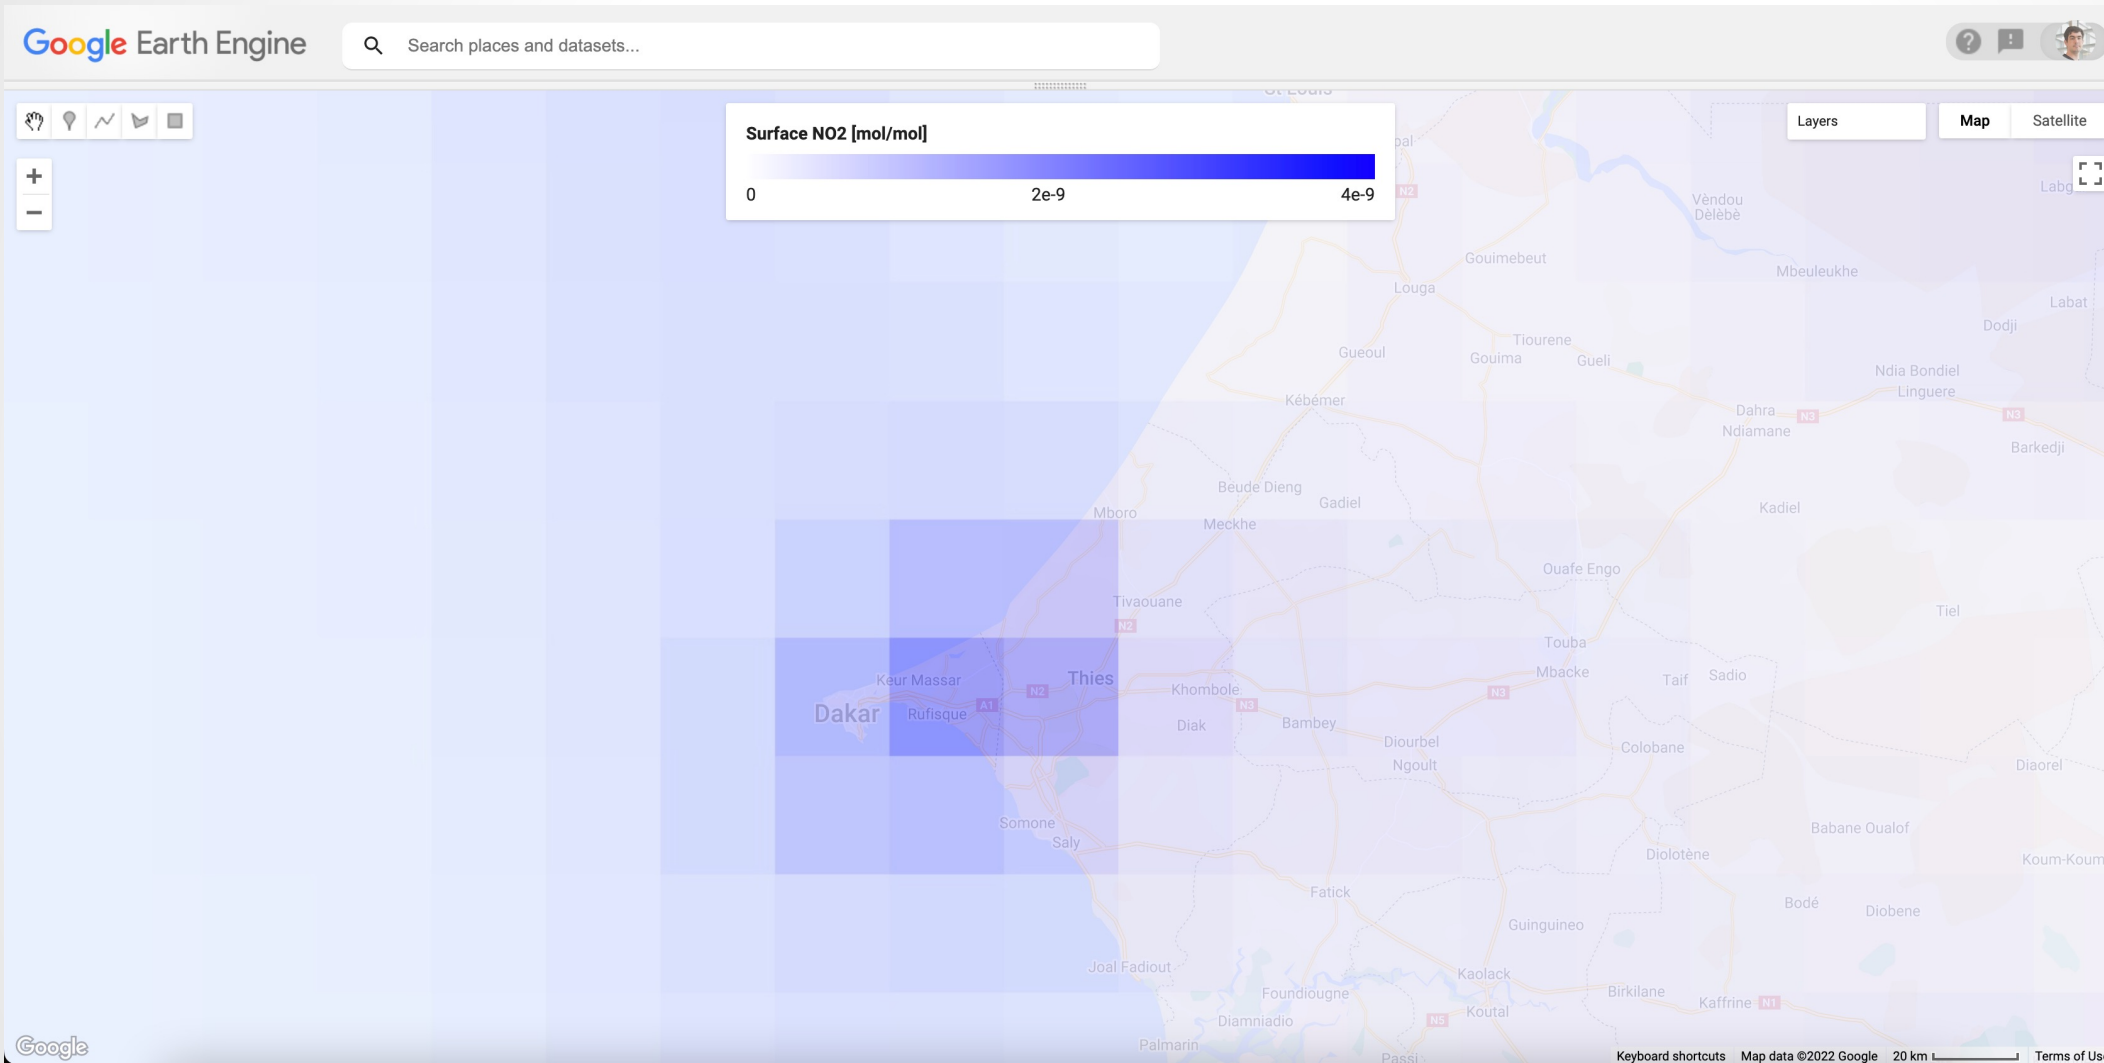

Demonstration of Data Fusion in GEE (preliminary)

Demonstration of Data Fusion in GEE (preliminary)

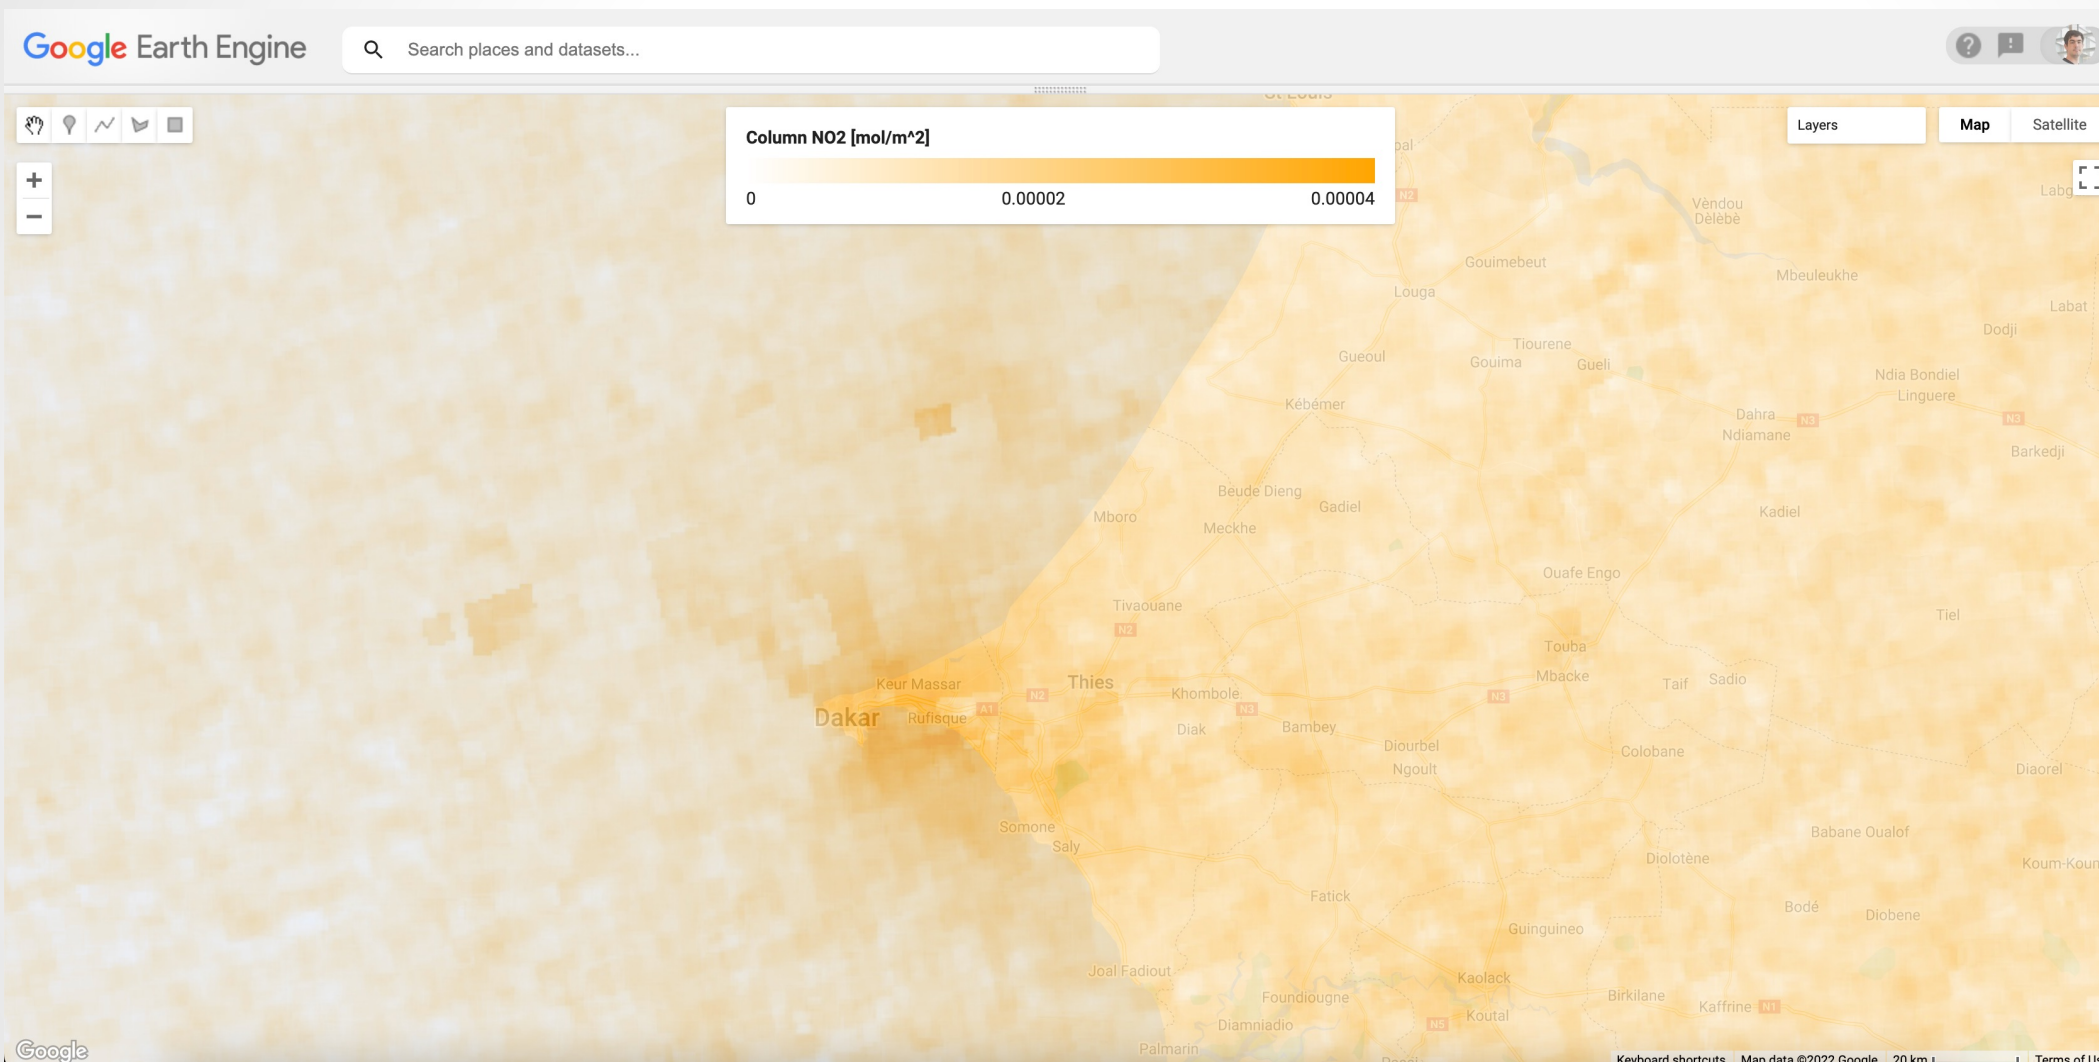

Calibration

Model

The data fusion starts from the model estimated surface concentrations. In this case the GEOS-CF model is used to provide the basic surface concentration estimates. What is shown here is a one-week average of GEOS-CF surface NO₂. This is already available through GEE. Note the spatial resolution of the model (the sizes of the squares) as they compare to Dakar.

Demonstration of Data Fusion in GEE (preliminary)

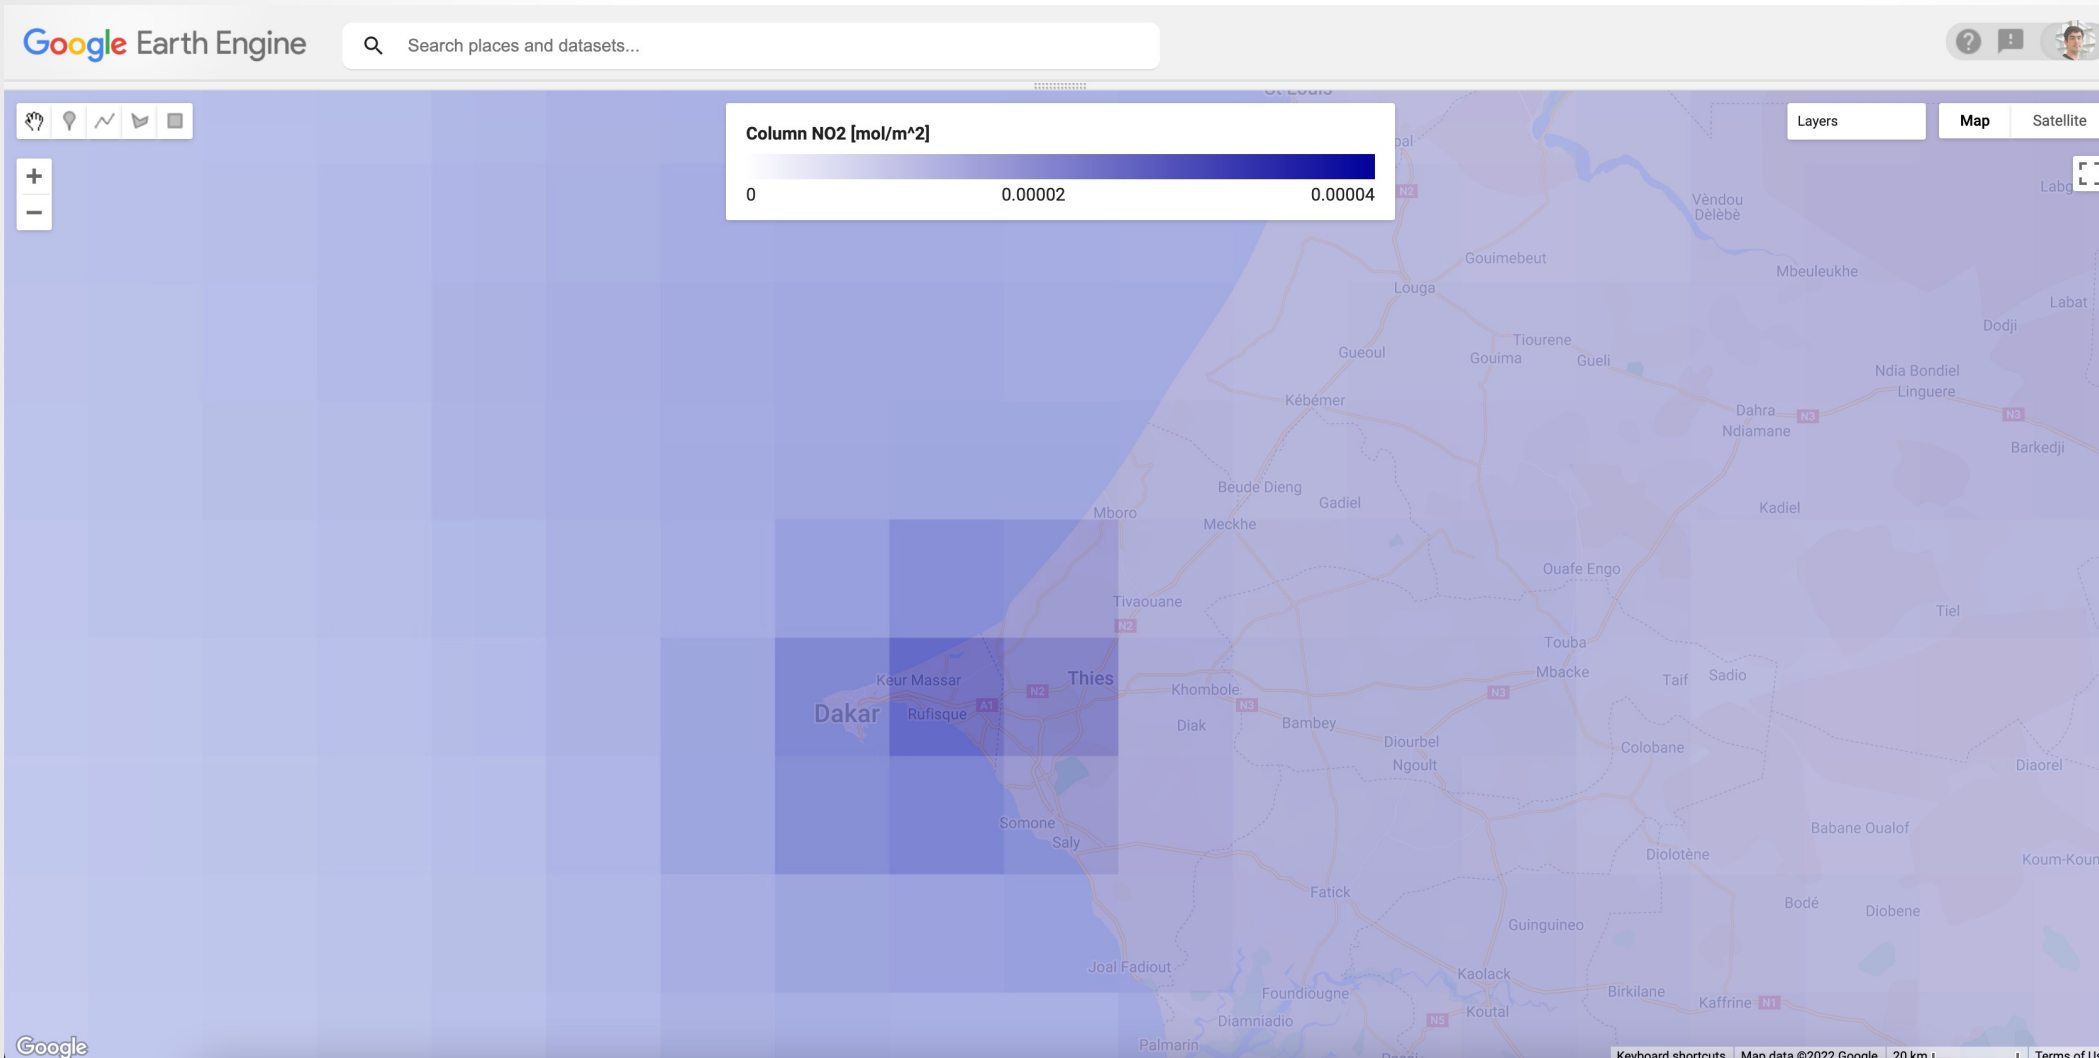

Calibration

Model

Satellite

The next step is to bring in satellite data (in this case, tropospheric column NO₂ information from the ESA TROPOMI instrument, available through GEE). This is the average for the same week as before. Note the differences in spatial resolution and detail compared to what was available from the model.

Demonstration of Data Fusion in GEE (preliminary)

Calibration

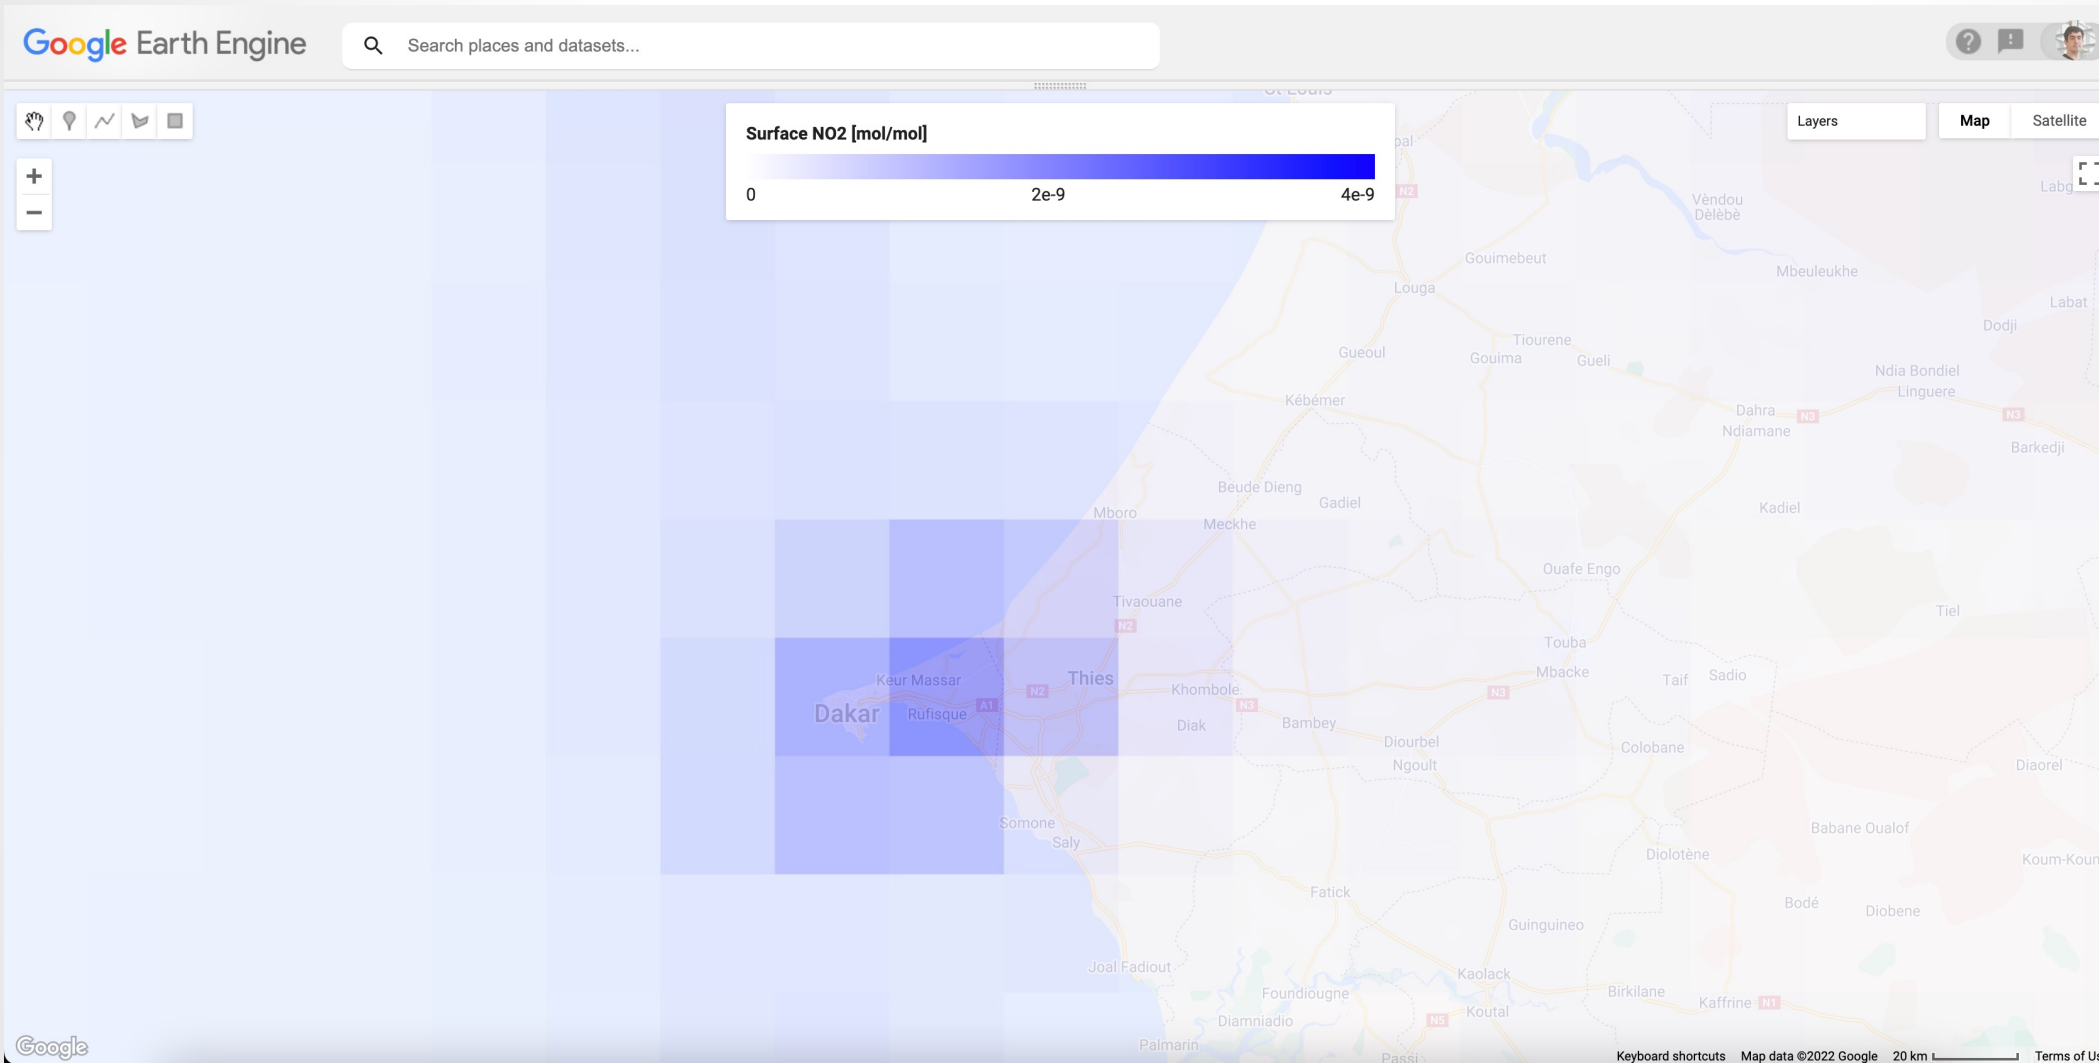

Model

Satellite

Calibrated Relationship

Based on data from a calibration period, typical relationships are established between the satellite and model datasets, facilitated by ancillary information (e.g., the model-estimated tropospheric NO₂ columns, shown here).

Demonstration of Data Fusion in GEE (preliminary)

Calibration

Calibrated Relationship

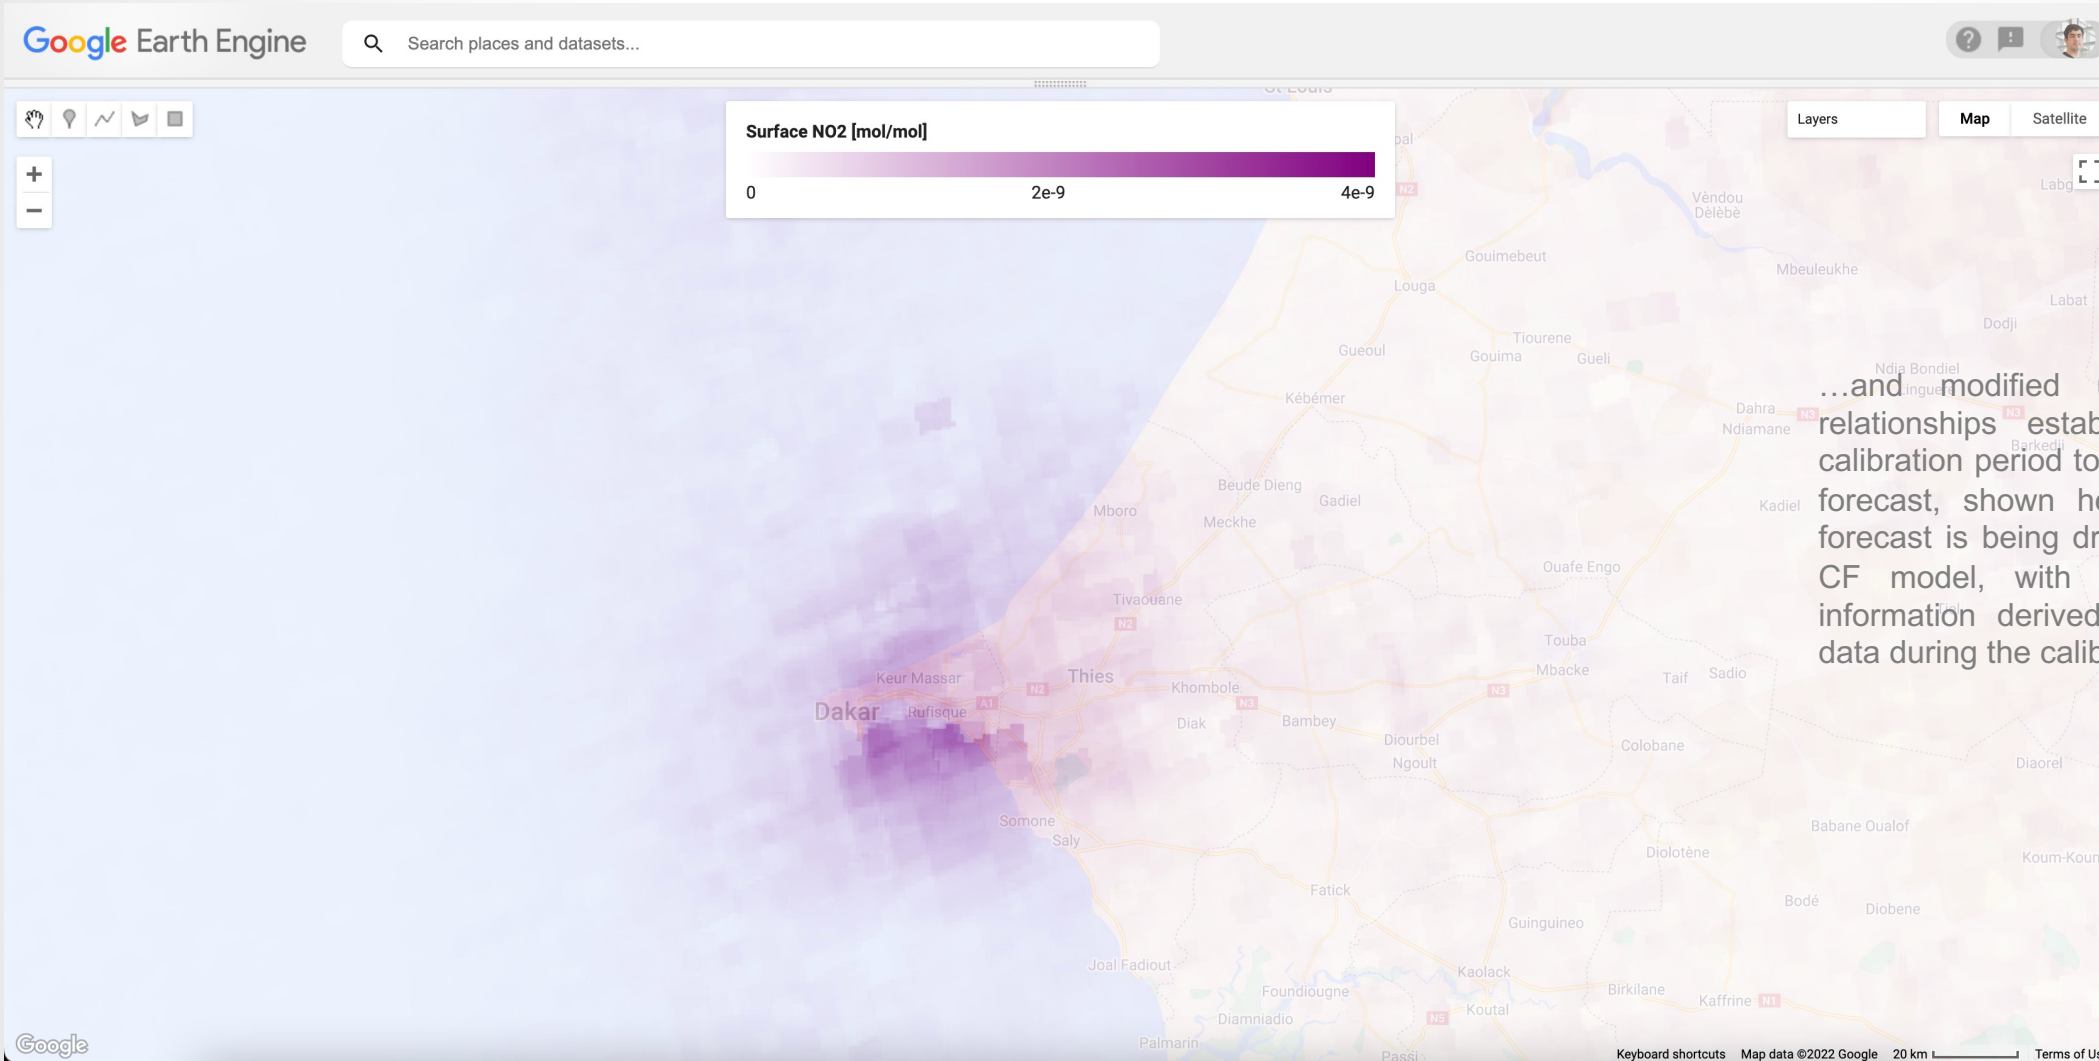

Application

For forecasting, GEOS-CF forecasts are used to drive the data fusion forecast...

Demonstration of Data Fusion in GEE (preliminary)

...and modified using the typical relationships established during the calibration period to generate the fused forecast, shown here. Note that the forecast is being driven by the GEOS-CF model, with additional sub-grid information derived from the satellite data during the calibration period.

Demonstration of Data Fusion in GEE (preliminary)

Comparison during Calibration Period

This timeseries illustrates how the data fusion approach, by successively incorporating more data sources, brings the estimates into closer agreement with the “ground truth” represented by the local regulatory monitor data. Keep in mind that in this example, these regulatory monitor data are synthetic, but nonetheless the data fusion methodology is performing as we would expect.

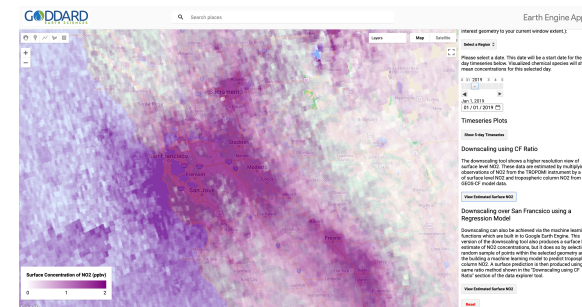

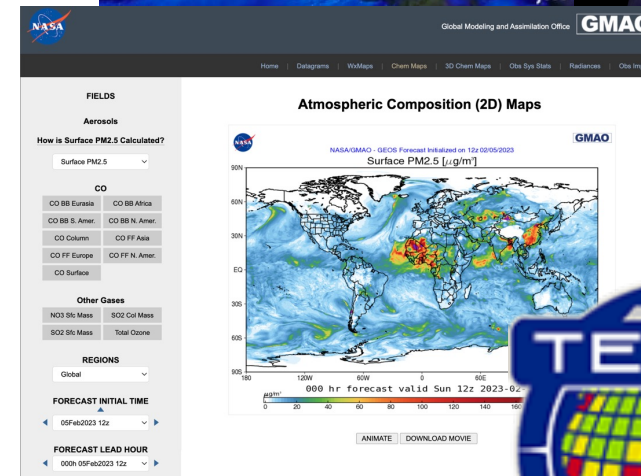

Calibration

Summary

- ❖ GMAO has a state-of-the-science Earth System model and data assimilation system
- ❖ GMAO products are available to the public with file formats for both scientists and air quality managers to use.
- ❖ NASA products are research products
- ❖ Expanding our capability to provide downscaled bias-corrected and data-constrained forecasts is a priority
- ❖ We want to hear from you so we can make our products as useful as possible!

Thank you for listening!

GEOS-CF v1 Status

- Daily GEOS-CF global 5-day composition forecasts at 0.25° (25km) resolution are generated in near-real time:
 - High-resolution historical estimates for fields are available since January 2018
 - Forecast visualizations and links to data available at fluid.nccs.nasa.gov/cf and [/cf_map](#)

Keller, C. A., et al. (2021). **Description of the NASA GEOS composition forecast modeling system GEOS-CF v1.0.** *Journal of Advances in Modeling Earth Systems*, 13, e2020MS002413. <https://doi.org/10.1029/2020MS002413>

- Applications include:
 - NASA field missions (e.g., SCOAPE, FIREX-AQ, ACT-America, TRACER-AQ)
 - Daily alerts sent to NASA TOLNet lidar teams (Matt Johnson, NASA Ames)
 - TEMPO a priori for trace gas retrieval
 - Cloud platforms, e.g., Google Earth Engine, WRI Resource Watch, CDC Tracker
