

A Tale of Two Blizzards

1977

2022

Blizzards have unique identifying characteristics distinguishing one from another. The Blizzard of 1977 severely impacted western New York, specifically the Buffalo metro region, and is often cited as the benchmark event by which other blizzard events are compared. That is, until a blizzard struck the area December 23-27, 2022, rendering the city paralyzed and claiming more lives than its 1977 predecessor. The above images show a comparison of the frozen state of the Great Lakes just prior to the blizzards of 1977 (left) and 2022 (right). Notice that Lake Erie was almost completely frozen over at the onset of the 1977 blizzard, while it is ice-free at the onset of the massive 2022 blizzard.
